

Kornet Express - Current-Implementation Client Demo Runbook

CURRENT-IMPLEMENTATION DEMO RUNBOOK

Evidence cutoff: 2026-10-09. This runbook follows the current source tree, the supplied production-browser snapshots, the bundled local SQLite database (read-only inspection), recent Git history, and the latest QA notes. **Important:** Code behavior is confirmed where stated; the live production database was **not** freshly authenticated or fully verified. Do not treat historical QA notes, README defaults, or a stale browser snapshot as live proof.

Confidence labels: **CONFIRMED** = directly verified in current code/UI/local DB; **HIGH CONFIDENCE** = corroborated by code and recent QA notes; **INFERRED** = reasonable interpretation; **UNKNOWN** = not established from current evidence.

01

CURRENT APPLICATION OVERVIEW

Architecture and entry points

- **Frontend:** React 18 + TypeScript + Vite; React Router, TanStack Query, Zustand, Tailwind/custom UI, Recharts. The active frontend entry is `main.tsx` to `App.tsx` to protected `AppShell.tsx` and `routes.tsx`. **CONFIRMED**
- **Backend:** Node.js 22 + Express + TypeScript. `server/src/index.ts` serves `/api`, health at `/api/health`, and the built SPA; `server/src/routes/index.ts` mounts auth, users, company, audit, support, FS, portal, and logistics routes. **CONFIRMED**
- **Operational database:** SQLite through Prisma (`server/prisma/schema.prisma` , `DATABASE_URL`). **Accounting ledger:** a separate SQLite `accounting.db` , accessed through the FS ledger code (Node `node:sqlite`); operational records are bridged into it. **CONFIRMED**
- **Authentication:** internal `/login` ; backend login issues access/refresh tokens, stores hashed refresh tokens, rotates refresh tokens, and records last login. Failed username/IP attempts are temporarily blocked after repeated failures in the current server process. The production secrets must be configured; no current production account/password is verified here. **CONFIRMED**
- **Scope/RBAC:** API routes are authenticated and set the company scope to KORNET. Roles include operations/operator, accounting/accountant, manager, admin, superadmin, and viewer in code/route guards; FS additionally checks `canAccessFs` . Some UI visibility and API write guards differ, so do not promise a role matrix without checking the actual account. **CONFIRMED**
- **Main signed-in start page:** `/dashboard` . Public routes outside the ERP shell: `/track` , `/track/:ref` , `/portal/login` , and `/portal` . **CONFIRMED**
- **Navigation actually generated by the active shell:** Dashboard; Operations (Quotes, Ocean Export/Import, Air Export/Import, Domestic/Trucking, P/D Orders, Vehicle Inventory, Fleet & Dispatch, Customer Tracking); Billing (Invoices & Credits, Receivables, Payables, Disbursements, Accounting Bridge); Ledger (FS) (overview, journals, vouchers, chart of accounts, reports, posting, month-end, banks, suppliers, signatories); Directories (customers/vendors, ports, billing codes, tariffs/rates; currencies is a route but hidden); Admin (users, settings, integrations, audit log; UI Kit). Some detail/board routes are hidden from the menu. **CONFIRMED**
- **Legacy/alternate UI:** `LogisticsSidebar` and `LogisticsSystem / FSSystem` files remain in source, but the active `App.tsx` routes through `AppShell` and `appRoutes` . Do not use the legacy sidebar as the authoritative current menu. **CONFIRMED**

Major modules and records

Module	Principal records / user work	Current evidence
Dashboard	Active files by mode/status; ETA/cutoff/P&D counts; accounting bridge queue; AR/AP; month-to-date revenue, cost, gross profit/margin; worklists	Server-backed summary and charts in <code>Dashboard.tsx</code>
Quotes	Create/edit quote, lane, customer, cargo, sell/buy charges; statuses; print; convert to shipment	<code>QuotesPage.tsx</code> , <code>/quotes</code> routes
Ocean/Air/Dome stic files	General details, route/parties, cargo, containers where applicable, charges, documents, import operations, timeline/status, accounting and close check	<code>ShipmentWorkspace.tsx</code> , <code>ShipmentTabs.tsx</code>
Transport documents	Draft/edit/issue BL/HBL/AWB/HAWB, arrival notices, delivery orders, manifests, cargo releases, and domestic DR/waybill paths	<code>TransportDoc</code> model and shipment document UI; issue behavior depends on document class/type
Billing	Sales invoices/credit documents; AR receipts/applications; AP bills; check disbursements; bridge queue	<code>billing/pages.tsx</code>
Accounting Bridge / FS	Validate/trial and final-post bridge records; journals, vouchers, accounts, reports, fiscal period/checklist	<code>ledger.ts</code> , <code>server/src/routes/fs.ts</code> , <code>server/src/lib/fsLedger.ts</code>
P/D and fleet	Pick-up/delivery orders, dispatch board, drivers, fleet vehicles, dispatch routes/statuses	<code>PdOrdersPage.tsx</code> , <code>FleetDispatchPage.tsx</code>
Vehicle inventory	Vehicle/RoRo inventory, VIN and title/customs/inspection workflow	<code>VehicleInventoryPage.tsx</code>
Tracking/portal	Minimal public shipment status/route/public milestones; signed-in customer shipment list	<code>PortalPages.tsx</code>
Masters/admin	Parties, ports, billing codes, rates, currencies, users, company settings, integrations catalogue, audit log	Routes in <code>routes.tsx</code>

Database model groups

The current Prisma schema has models for: users/refresh tokens; support tickets; company/settings/sequences; parties, ports, carriers, billing codes, tariffs; quotes and shipments; transport docs, cargo lines, containers, charges; invoices/lines, AP bills/lines, receipts/applications, check

disbursements/applications/expenses, bridge items; vehicles, P&D orders, drivers, fleet vehicles, dispatch routes; status events, tracking items; web accounts/users; attachments, integrations, audit logs. **CONFIRMED** in `schema.prisma`. Statuses are strings, not a single enforced enum.

APIs, integrations, and document output

- Primary operational API is under `/api`; key resource paths include `/quotes`, `/shipments`, `/cargo-lines`, `/containers`, `/charges`, `/transport-docs`, `/status-events`, `/invoices`, `/ap-bills`, `/receipts`, `/checks`, `/bridge`, `/pd-orders`, `/vehicles`, `/drivers`, `/fleet-vehicles`, `/dispatch-routes`, and `/dashboard/summary`. Requests generally require an authenticated bearer token and KORNET scope. **CONFIRMED**
- The accounting integration is an in-process bridge into a separate FS SQLite ledger; it is not evidence of a cloud accounting SaaS integration. **CONFIRMED**
- The app has an integrations catalogue for barcode/QR scanner, signature pad, label/waybill printer, BOC e2m, and carrier tracking API. The UI can store connected/disconnected/error flags. The catalogue and toggle are **not proof** that those external systems are implemented or connected; defaults are disconnected. **CONFIRMED**
- Shipment/transport-document and billing print flows render browser HTML and call `window.print()` (browser can offer "Save as PDF"). Excel export is present in billing UI. FS report screens request report data from the backend. Do not describe a server-side PDF service or an external carrier API as available. **CONFIRMED**
- Customer portal UI explicitly says downloadable documents and invoice-balance endpoints are not implemented; public tracking exposes only minimal status, route, ETA/ETD, and public milestones. **CONFIRMED**

02 CURRENT BUSINESS PROCESS MAP

Quote to shipment

- 1 START: Operations > Quotes
- 2 Quote list/editor: customer, mode/direction, lane, validity, cargo, charges
- 3 to Save
- 4 POST/PATCH `/api/quotes` + cargo/charge create/update APIs
- 5 Quote, CargoLine and Charge records stored; quote status is maintained separately
- 6 to Accepted/eligible and not expired/rejected
- 7 Convert action to POST `/api/quotes/:id/convert`
- 8 Shipment created as BOOKED; quote cargo and charges copied; shipment sequence assigned
- 9 Shipment workspace to operations, documents, status events, accounting, close checks

Conversion rejects rejected/expired or elapsed-validity quotes; an already-converted quote returns its linked shipment. Recent code recalculates copied cargo totals when the new shipment's derived totals are zero. **CONFIRMED**

Shipment operations and tracking

- 1 START: Operations > Ocean/Air/Domestic file list
- 2 Open file to General / Cargo / Containers / Charges / Documents / Timeline / Accounting / Close
- 3 Create/update shipment, cargo, container, charge, doc, or status event
- 4 POST/PATCH `/api/shipments`, `/cargo-lines`, `/containers`, `/charges`,
- 5 `/transport-docs`, `/status-events`

- 6 Shipment and child records updated; cargo edits recalculate shipment totals;
- 7 tariff application may create/update charges when a matching tariff exists
- 8 Status steps in the UI: BOOKED to LOADED to IN_TRANSIT to ARRIVED to CLEARED
- 9 to DELIVERED to CLOSED
- 10 Status events can include code, location, notes, and public visibility
- 11 /track/:ref can show only public milestones and limited shipment details

The visible steps are confirmed in UI code; particular transition guards and event requirements must be checked against the live record before demonstrating transitions. Closing has a close-check/preflight; a closed shipment is immutable. Reopening is role-restricted and requires a reason. Do not use a close/reopen button in a client demo. **CONFIRMED**

Transport document to finance and ledger

- 1 START: Shipment workspace > Documents
- 2 Create/edit HOUSE freight document; issue it
- 3 to POST /api/transport-docs/:id/issue
- 4 For eligible HOUSE BL/HBL/AWB/HAWB documents, code creates eligible
- 5 sales-invoice and AP-bill DRAFTS (not posted); Master and domestic DR/waybill
- 6 documents do not trigger this automation
- 7 Billing > Invoices & Credits / Payables
- 8 Review/edit/post invoices or AP bills; receipts/checks can settle balances
- 9 Accounting Bridge: trial validation, then final posting if authorized
- 10 Bridge journal is written to FS ledger; FS Reports / Month-End can show results

Issuing a house document is a **write** that can create records in billing; do not issue a new document live. Recent QA says the automatic drafts were tested, but current data was not independently confirmed in the live session. Posting is a separate financial action. **HIGH CONFIDENCE**

Other operational workflows

- **P/D:** create/update P&D order to assign/dispatch via board and route/resource records to status changes to completed order. Recent code prevents invalid dispatch selections and uses separate route/vehicle/driver resources; full live workflow remains un-certified.
- **Fleet:** maintain driver and vehicle masters to create dispatch route with resources to track route stage/status. No current demo-quality records were independently verified.
- **Vehicle/RoRo:** create vehicle record with VIN and title/customs/inspection fields to update statuses/holds to issue related docs as applicable. Do not assert exact gate statuses without the live sample.

Documentation statement or risk	Current implementation evidence / discrepancy
README describes the menu and feature set as the current product.	The actual signed-in menu comes from <code>AppShell</code> + <code>appRoutes</code> ; a separate <code>LogisticsSidebar</code> remains in the repository and should not be treated as the active navigation. Use the menu in the live app.
README lists a default internal username/password.	That is not a verified production login. Backend production requires configured JWT secrets, but there is no source evidence that a default user exists or is enabled in production. Use a currently authorized account only.
README describes an authenticated customer portal and customer tracking.	<code>/portal</code> and <code>/track</code> exist, but the portal screen explicitly reports no downloadable-documents endpoint and no invoice-balance endpoint. Public tracking only returns minimal information and public milestones.
README describes several accounting functions and compliance coverage.	Invoice/AR/AP/check/bridge/FS screens and VAT/EWT fields exist. This is implementation evidence, not an independent certification of tax/legal compliance, accounting policy, or every edge case.
README mentions live FX/connected integrations.	The integration screen is a persisted status catalogue; its default entries are disconnected. Source search did not establish a live provider for exchange rates, carrier status, BOC e2m, scanners, or signature pads. Do not claim these external connections work.
README advertises many keyboard shortcuts.	The active shell registers only a subset of the documented <code>6</code> sequences; the README list is not a reliable live shortcut reference. Use visible menu clicks during the demo.
Handoff notes describe production QA data as current and fully linked.	Local bundled DB and attached live-browser snapshot do not match those QA IDs/statuses. Handoff is useful history, not current live-data proof. Verify all candidate records after a fresh authenticated login.
<code>HANDOFF.md</code> and source code may describe slightly different finance automation timing.	Current source issues eligible draft invoice/AP records on eligible HOUSE freight document issuance. This does not post them. Confirm the actual document class/type and the displayed success message; never assume a master or domestic doc triggers it.

Recent committed history (2026-10-09) includes:

- **Dashboard accuracy:** corrected accounting/worklist metrics; completed jobs excluded from today's P&D count. Use dashboard counts as live data only after fresh load. Commits `d4bcf4d`, `f07451f`.
- **Dispatch:** route/resource workflow corrected and invalid selections blocked. Commits `867b6e4`, `a772524`.
- **Quote conversion:** cargo totals now recalculated when a converted shipment's derived aggregates are zero. Commit `f361e4b`.
- **Transport document issuance:** eligible HOUSE BL/HBL/AWB/HAWB issuance now creates financial drafts; finance list caches refresh afterward. Commits `8860d57`, `2bb8bc1`.
- **Finance bridge:** FS unposted counts exclude already posted rows; printed check and bank metadata are preserved. Commits `6d8f64f`, `de587b9`.
- **Charges:** charge CRUD was fixed; recent change `34ccba9` syncs linked draft finance when charges are edited. Financial fields are locked after billing/posting; don't edit financial values on a posted record.
- **UI/master data:** commit `45bcc7b` touched layouts, entity text, new charges, airline data and seed/reseed scripts. Vehicle inspection sequence numbering was separated in `d598668`.

At inspection start, concurrent uncommitted work was visible in `HANDOFF.md`, `server/src/routes/logistics.ts`, and a UI overlay file. Those changes may still be in progress; re-check the final production build before presenting. No changes to those files were made for this runbook.

Scores are overall demo-fit scores (1-10), balancing business value, end-to-end integration, visual clarity, ease, available data, and live-demo reliability.

Candidate	Score	Why / limitation
Quote to Ocean Export to issued house BL to draft invoice/AP to settlement/bridge to FS	8/10	Best coherent cross-functional story and strongest value. A historical synthetic QA chain exists in the handoff, but current live availability is unverified and several posting steps are risky. Best as a read-only completed-record tour after preflight.
Existing Ocean Export file to cargo/charges/docs/status to public tracking	7/10	Strong operational story with a confirmed current browser list row. The displayed row was sparse (no visible route/ETD/ETA and 0% margin); status details and tracking milestones were not verified.
P/D order to dispatch assignment to fleet route	6/10	Relevant domestic operations and recent dispatch fixes, but no current demo-quality record or full live workflow has been verified.
Vehicle inventory / RoRo / title/customs checks	5/10	Distinctive workflow, but less integrated with the complete billing-to-ledger story and sample readiness is unknown.
Air Export/Import transaction	5/10	Broad logistics relevance and specialized weight/document fields, but no live end-to-end sample was verified; airline-data changes are recent.

Candidate	Score	Why / limitation
FS ledger/report-only	6/10	Management/accounting value and report screens exist, but the story starts too late in the business process and requires FS permissions and period/data validation.

06 RECOMMENDED DEMO SCENARIO

One scenario: follow a single, already-completed **synthetic Ocean Export LCL** transaction from its accepted quote through shipment, house bill, billing, settlement, and ledger bridge. Use it only as a read-only linked-record walkthrough; do not create, issue, post, settle, close, reopen, or edit anything live.

Historical runbook evidence names quote [QT-2026-00002](#) to shipment [OE-2026-00002](#) (closed), one synthetic crate (720 kg, 1.2 CBM), issued QA HBL, PHP 1,200 revenue / PHP 720 cost / PHP 480 gross profit, sales invoice SI-2026-000001 paid at PHP 1,344, AP bill AP-2026-000001 paid at PHP 792, receipt/check, and posted bridge journals. This is **HIGH CONFIDENCE as a previous controlled QA run**, not as today's current production DB state.

Live go/no-go before using it: fresh sign-in; search the exact quote/file/document/invoice/AP records; verify they are all linked and statuses/amounts agree; verify portal tracking only if it has public milestones; verify the displayed data is clearly synthetic and acceptable to show. The supplied browser snapshot had a 401 event and showed only [OE-2026-00001](#) (BOOKED) with blank route/ETD/ETA and 0% margin. The local bundled SQLite file has different IDs and states (seven OE files including a locally closed [OE-2026-00003](#), and four draft quotes). These are different data sources. **Do not infer that the production QA chain is currently present.**

If the QA chain does not appear after a fresh login, do **not** create lookalike transactions in production. Use the sparse [OE-2026-00001](#) only as a read-only fallback, keep the demo to the dashboard/list/workspace fields actually present, skip claims about customer value or finance continuity, and schedule the complete integrated demo against a verified demo tenant.

07 EXACT SCREEN-BY-SCREEN DEMO FLOW

All client-facing actions below are read-only. The first 12 steps apply only if the go/no-go check finds the historical QA chain in the intended demo environment.

Step	Screen / action	What to select / enter	Expected result	Business purpose and spoken line	Confidence
1	/login	Use the approved demo account; do not use guessed/default credentials	Signed-in user lands at /dashboard	"I'll start with the operational view so we can follow one job through its business lifecycle."	CONFIRMED route; account UNKNOWN
2	Dashboard	Read the live cards and worklists; do not quote numbers until refreshed and consistent	Active-file and work queues render from server summary	"This brings operational activity and finance queues into one place; the figures are live only when the current refresh succeeds."	CONFIRMED UI; values UNKNOWN
3	Operations to Quotes	Search QT-2026-00002 if present; open without editing	Quote displays the saved lane, cargo, customer, charges, and converted state/link	"The commercial estimate is the starting point; once accepted, it becomes the operational file rather than being re-keyed."	Historical data HIGH CONFIDENCE ; live presence UNKNOWN
4	Ocean Export	Search/select OE-2026-00002 only if it matches the quote and is visibly QA-labelled	Shipment workspace opens; status shown as CLOSED in historical QA record	"Now we're looking at the shipment record that carries the operational details behind the quote."	Historical state HIGH CONFIDENCE ; live presence UNKNOWN
5	General / Cargo	Read the existing cargo line; do not save	Historical test line: 1 crate, 720 kg, 1.2 CBM; shipment totals visible if current record matches	"The shipment captures handling facts once, then uses them in its documents and charges."	Historical numbers HIGH CONFIDENCE
6	Charges / Accounting tab	Read charge line and summary; do not edit	Historical QA: bill PHP 1,200, cost PHP 720, profit PHP 480 / 40% margin	"This makes the file's commercial contribution visible alongside its operating work."	Historical numbers HIGH CONFIDENCE ; current screen layout CONFIRMED
7	Documents	Open the already-issued QA HBL; do not click Issue, Edit, or Print unless pretested	Existing issued house bill and linked shipment/cargo display	"The transport document is tied to the shipment record, not maintained as an unrelated attachment."	Existence/status HIGH CONFIDENCE historically
8	Timeline / Tracking	Show existing milestones; if none appear, skip public tracking	Public tracking can show status, route, dates and public milestones only	"A customer-facing tracking view can share selected milestones without exposing the internal finance record."	Capability CONFIRMED ; data availability UNKNOWN
9	Billing to Invoices & Credits	Search/open SI-2026-00001 ; no post/void/edit	Historical QA invoice is PAID; PHP 1,200 taxable sales + PHP 144 VAT = PHP 1,344 total	"The operational work can flow into a customer invoice, with its balance visible to finance."	Historical data HIGH CONFIDENCE
10	Billing to Payables	Search/open AP-2026-00001 ; no posting/payment action	Historical QA AP bill is PAID; PHP 720 cost + PHP 86.40 input VAT - PHP 14.40 EWT = PHP 792	"The same file can show the associated supplier obligation, so revenue is not the only side of the transaction."	Historical data HIGH CONFIDENCE

Step	Screen / action	What to select / enter	Expected result	Business purpose and spoken line	Confidence
11	Receivables / Disbursements	Read the existing receipt/check records only if their references match the file	Historical QA receipt PHP 1,344 and check voucher PHP 792; both fully applied/paid	"Collections and disbursements close the balances; this is a view of the existing test transaction, not a payment we are making today."	Historical data HIGH CONFIDENCE
12	Accounting Bridge	Locate matching posted bridge rows; do not trial/final-post	Historical records are POSTED and balanced; verify current page shows matching status	"The finance handoff is a controlled bridge into the ledger, rather than an unexplained manual re-entry."	Historical QA HIGH CONFIDENCE ; current visibility UNKNOWN
13	FS Ledger Overview / Reports	Only if the account has FS permission; read a matching journal/report	Existing posted journal/report can be viewed; do not run posting, recompute, or month-end	"Management can inspect the accounting result downstream. We are viewing an existing posting, not changing the books."	Screens CONFIRMED ; transaction/report present UNKNOWN
14	Dashboard	Return to dashboard and show current summary only if no API error	Refreshed file/finance overview	"We end where we started: at the shared operational picture, with the detail traceable back to the job."	UI CONFIRMED ; values UNKNOWN

Fallback if QA records fail verification: use the current browser-confirmed Ocean Export list row [0E-2026-00001](#) in BOOKED status as a list/workspace tour only. Open it only if the button responds after the fresh session; show existing General/Cargo/Charges/Docs/Timeline/Close-check information without saving. The browser snapshot showed the list row but did **not** confirm that its editor opens, that child records exist, or that it has non-empty routing, charge, or tracking details. Skip steps 3 and 7-13; do not promise the unseen downstream data.

08 15-MINUTE SPOKEN DEMO SCRIPT

Time	Screen / action	Spoken talking point	Expected result
0:00-1:30	Opening, then Dashboard	"Kornet's work spans customer commitments, shipment handling, billing, and accounting. I'll use one existing test shipment to show how those views connect, without changing any live records."	Dashboard opens. If an API error appears, acknowledge it and do not quote stale values.
1:30-3:00	Dashboard cards/worklists	"This is the control view: teams can orient around files, upcoming operational work, and finance queues. Each figure should be traceable to the current server response."	Current counts render; no unsupported number or trend is claimed.
3:00-4:30	Quotes to existing QA quote	"The quote captures the proposed lane, customer, cargo, and commercial charges. When accepted, it can be converted into a shipment file."	Quote and conversion link are visible, if live record exists. Do not click Convert.
4:30-6:00	Ocean Export to linked file; General/Cargo	"The file becomes the operational record. Teams can see parties, routing, cargo, and the shipment totals in one workspace."	Linked shipment opens and historical cargo facts match.
6:00-7:30	Charges / Accounting	"The shipment keeps customer billings and operating costs together, so the team can review the file's contribution before it is closed."	Existing charge and margin summary appear; values match live record.
7:30-9:00	Documents / Timeline	"The transport document and event history sit with the shipment. Selected public milestones can support customer tracking."	Issued HBL and any public milestones display. If milestones are absent, explain only the capability, not a live event.
9:00-10:30	Customer Tracking (<code>/track/<verified reference></code>)	"The public lookup is intentionally limited to basic shipment visibility and public milestones; it is not the customer's invoice or document-download portal."	Public result shows only fields actually returned. No confidential contact or internal finance data.
10:30-12:00	Billing invoice and AP bill	"Finance can see both the customer receivable and supplier cost associated with the shipment. Balances show what remains to collect or pay."	The existing invoice/AP records and totals match; no post/pay action.
12:00-13:30	Bridge / FS read-only view	"The bridge makes the accounting handoff inspectable. A posted journal is the downstream accounting record; this screen is not an automatic external accounting service."	Matching bridge or journal appears only if account access and record are verified.
13:30-15:00	Return to Dashboard; close	"The value is continuity: one operational file can inform documents, finance, and management visibility. We have looked at a controlled test transaction; next we can map your actual approval rules, customer access, and integrations."	Return to dashboard; leave the data unchanged.

If the linked test record is unavailable, use the read-only fallback in section 7 and say plainly that the current session is showing the booking record only; schedule a verified end-to-end data set rather than improvising.

09 ONE-PAGE DEMO CHEAT SHEET

- Login:** approved assigned demo account only; no password is recorded here. Fresh sign-in first.
- Starting screen:** `/dashboard`; if dashboard/API error or 401, stop relying on its metrics.
- Demo scenario:** read-only walk through one synthetic Ocean Export LCL from quote to FS bridge, only after live record verification.
- Records to use:** preferred historical QA chain `QT-2026-00002` to `OE-2026-00002` to QA HBL to `SI-2026-000001` / `AP-2026-000001`; verify each live. Fallback: visible `OE-2026-00001` (BOOKED), list/workspace only.
- Screen sequence:** Dashboard to Quotes to Ocean Export to General/Cargo to Charges/Accounting to Documents/Timeline to Tracking to Invoice to Payables to Bridge/FS (permission permitting) to Dashboard.
- Key actions:** search/open existing records; read statuses, cargo, charges, and linked references; never save, issue, convert, post, pay, close, reopen, or edit.
- Key talking points:** one operational file connects the quote, shipment, transport document, billing, and accounting handoff; public tracking is deliberately limited.
- Expected results:** linked identifiers and statuses agree; historical QA figures match only if still present; no live data changes.
- Things NOT to click:** New, Save, Convert, Issue, Apply Tariffs, Generate Invoice/AP, Post/Final Post, Receive Payment, Print Check, Close/Reopen, Void, Month-End Close, integrations toggles.
- Recovery action:** return to Dashboard, refresh once, re-authenticate with approved account if 401; if records/API still fail, stop the data demo and use only approved current screenshots or reschedule with a verified demo tenant.

10 DEMO DATA CHECKLIST

Record	Where it exists / verification status	Why safe/useful
<code>OE-2026-00001</code> , BOOKED	Confirmed in the attached production-browser Ocean Export snapshot. Its row showed no visible route/ETD/ETA and 0% margin; editor/child rows were not verified.	Best fallback because it is the only transaction directly observed in that browser snapshot. Do not claim it has detailed cargo, charges, or tracking.
<code>QT-2026-00002</code> to <code>OE-2026-00002</code>	Described in the Oct 9 controlled-QA section of <code>HANDOFF.md</code> as production QA data; not present under those IDs in the bundled local DB and not freshly confirmed in production browser.	Best end-to-end story if freshly confirmed. QA-prefixed party/HBL makes synthetic nature explicit; disclose/use only with approval.
QA HBL <code>QA-HBL-OE-2026-00002</code> ; invoice <code>SI-2026-000001</code> ; AP <code>AP-2026-000001</code> ; receipt/check and bridge rows	Historical QA handoff lists these as issued/paid/posted and linked to <code>OE-00002</code> . Current live availability UNKNOWN .	Demonstrates transport document, AR/AP settlement, and ledger continuity without creating records-after verifying identifiers and values.
<code>OE-2026-00003</code> and auto-generated draft invoice/AP	Historical handoff says issuing the QA HOUSE BL generated invoice <code>SI-2026-000002</code> and AP bill <code>AP-2026-000002</code> , both DRAFT. The bundled local DB has a different <code>OE-00003</code> row (CLOSED, 800 kg); do not conflate them.	Useful for developer validation only; not the recommended client story because drafts/periods differ and accidental posting is a risk.
Local SQLite <code>kornet.db</code> sample	Read-only local inspection found seven <code>OE-2026-*</code> shipment rows, four <code>QT-2026-*</code> quote rows; local states/IDs differ from the handoff. File: <code>kornet-system/server/prisma/data/kornet.db</code> .	Local DB can support rehearsals only after confirming local environment and synthetic data. It is not proof of production records.

No customer personal details, passwords, TINs, or production credentials are included. If showing QA labels to a client is not appropriate, use a sanitized non-production tenant instead.

11 PRE-DEMO SYSTEM CHECKLIST

- Confirm with the application owner which environment is approved for client viewing; prefer a sanitized demo tenant over production.
- Sign in with the assigned account, confirm role and any FS permission, and test session refresh before the client joins. Do not test credentials by guessing; repeated failures trigger a temporary lock.
- Refresh Dashboard and confirm `/api/health`/screens load without 401/5xx banners. Do not cite dashboard numbers unless the latest response succeeded.
- Search each proposed QA identifier in the same environment; check the quote-shipment link, shipment status, HBL, invoice/AP balances, receipt/check, bridge, and period. Ensure no IDs or values are silently taken from local DB/HANDOFF.
- Ensure the exact company data is synthetic/approved for external display; hide unrelated customer names, emails, TINs, bank/check details, and browser/portal credentials.
- Verify screen size and navigation; use visible menu clicks, not shortcuts claimed in the README.

- Open the transaction and tracking page in advance using read-only GET/display actions; do not issue/print/post/close anything as a preflight.
- If using a public tracking reference, test only the chosen approved reference; confirm it has public milestones and no unintended contact or financial information.
- Confirm pop-ups are allowed only if a pre-approved print preview is part of the demo; otherwise omit print/PDF.
- Have the read-only fallback or approved current screenshots ready. Check that concurrent code/deployment work has finished and that the deployed build matches the rehearsed app.

12 DEMO FAILURE/RECOVERY PLAN

Risk	Severity	Prevention	Backup
Expired auth / API 401 (already visible in supplied dashboard session)	High	Fresh sign-in; verify current API data before admitting attendees	Refresh once; re-authenticate with approved user. If still failing, stop live navigation and use approved current screenshots/reschedule.
Handoff/local/live data mismatch; QA record absent or stale	Critical	Search and match all IDs in the target tenant before demo	Do not create records in production. Fall back to the visible booking list only or reschedule on a verified demo DB.
Sparse booking row / empty routing, milestones, or charges	High	Open and inspect workspace before demo	Skip shipment detail/tracking/finance claims; show only confirmed list fields.
Triggering financial drafts by issuing HOUSE BL/HBL/AWB/HAWB	High	Do not click Issue in the client demo	Close the editor without saving; if clicked, stop and notify the system owner/accounting-do not delete or post the drafts.
Period mismatch (historical notes say FS open through Sep 2026 while drafts are dated Oct 2026)	High	Keep current drafts/posting/month-end off the demo path	Show existing posted records only; do not backdate, post, or close a period.
Tariff application produces no charges (QA handoff reported no active KORNET tariffs)	Medium	Avoid demonstrating automatic pricing unless active matching tariff is confirmed	Explain that charges can be entered/maintained; do not promise a rate result.
User lacks accounting/FS role permissions	Medium	Confirm account role and <code>canAccessFS</code> beforehand	Omit Billing/FS pages; do not switch to another user's session.
Public tracking has no public milestones/reference not found	Medium	Pretest only approved tracking reference	Skip lookup; explain the code-supported scope, not an unobserved result.
Popup blocked during print preview	Low	Avoid print during short demo; pretest if required	Skip printing. Browser print/save-as-PDF is not required for the main story.
Recent code/deployment changes alter layout or behavior	High	Freeze the demo build; smoke-test after deployment	Use approved screenshots or postpone. Do not test unreviewed concurrent changes live.
Incorrect dispatch, finance status, or stale dashboard metric	Medium	Use read-only actions and verify record status	Return to record list/dashboard; explain no workflow transition was attempted.

13 TOP 15 CLIENT QUESTIONS AND ANSWERS

#	Likely question	Recommended answer	Evidence	Confidence
1	Can a quote become a shipment without re-entering the job?	"The current workflow converts a quote to a shipment and copies its cargo and charges. We should confirm your acceptance and approval rules before configuring your process."	<code>convertQuote</code> logic and Quotes UI	CONFIRMED
2	Which shipment modes are covered?	"The menu includes Ocean Export/Import, Air Export/Import, and Domestic/Trucking, plus P&D, fleet, and vehicle inventory. Coverage of every operational edge case still needs process testing."	<code>appRoutes</code> , shipment workspace modes	CONFIRMED
3	Can customers track shipments online?	"There is public reference-based tracking and a customer sign-in view of linked shipments. Public results are limited to shipment status, route/dates, and public milestones."	<code>PortalPages.tsx</code> , portal API/routes	CONFIRMED
4	Can customers download documents or see invoice balances in the portal?	"The current portal UI says those endpoints are not implemented. I would not represent those as available today."	Explicit empty states in portal page	CONFIRMED
5	Do shipment status updates automatically come from carriers?	"The system can record status events and expose public milestones. A live carrier API is listed as a possible integration, but code does not prove a working carrier connection."	<code>StatusEvent</code> ; disconnected integration catalogue	CONFIRMED for manual/event c
6	Does it calculate freight revenue, cost, and margin per file?	"Charges carry bill and cost sides, and the UI computes a file contribution summary. Automatic tariff results depend on a matching active tariff; the recent QA record had no active KORNET tariffs."	<code>computeCharge</code> , <code>fileMarginPct</code> , tariff logic; handoff	HIGH CONFIDENCE
7	How does billing connect to shipment operations?	"The shipment workspace can generate billing records, and eligible HOUSE BL/HBL/AWB/HAWB issuance now creates invoice/AP drafts. Draft creation is not posting."	Current issue handler/domain service; commit <code>8860d57</code>	HIGH CONFIDENCE

#	Likely question	Recommended answer	Evidence	Confidence
8	Are collections, AP, and checks supported?	"There are AR receipts/applications, AP bills, check disbursements, and accounting bridge screens. We have not certified every partial-payment, reversal, withholding, or void scenario."	Prisma models, billing API/UI, current handoff caveats	CONFIRMED for screens; edge c
9	Does it post directly to our general ledger?	"The current installation bridges records to its separate FS SQLite ledger. Whether that matches your target ledger, chart, and production accounting controls must be validated; it is not proof of integration to another accounting product."	<code>fsLedger.ts</code> , FS routes	CONFIRMED
10	What reports are available?	"The app has dashboard summaries and FS report screens/API, including report and month-end views. We should verify the exact report formats and figures you require against your accounting team."	Dashboard component, FS report routes/UI	CONFIRMED
11	Does the system have role-based access and an audit trail?	"There are role checks, FS access checks, and an Audit Log screen/model. We should demonstrate the permissions and audit-event coverage with your actual role matrix rather than claim that every action is audited."	auth middleware, users/audit routes, <code>AuditLog</code> model	CONFIRMED for mechanisms; cc
12	Is data limited to Kordnet, or can we select companies?	"The current API sets one KORNET company scope. The current code does not provide a company selector."	<code>requireCompany</code> , company constant	CONFIRMED
13	Are BOC e2m, carrier tracking, scanners, printers, or signatures connected?	"They appear in an integration-status catalogue, but the source does not establish working external connectors. We should verify each requested interface and owner."	Integration store/catalogue	CONFIRMED catalogue; connect
14	Is the platform secure and ready to scale?	"The app has bearer-token auth, hashed refresh-token storage, role checks, Helmet, and login throttling. Repository inspection is not a security certification, scalability test, or deployment SLA."	Auth routes, middleware, server setup	CONFIRMED for listed controls; c
15	Can the product add features such as document downloads, carrier sync, or new workflows?	"Those are reasonable topics for a roadmap, but current customer document-download and invoice endpoints are explicitly absent, and external carrier integrations are unverified. We should scope and estimate them separately."	Portal empty states and integration catalogue	CONFIRMED current gaps; roadr

14 FEATURES I SHOULD NOT DEMONSTRATE

- **Do not** use README's default login values or claim they are production accounts.
- **Do not** create a new production quote/shipment, enter real client data, or use a customer record without clearance.
- **Do not** click Convert, Save, Apply Tariffs, Generate Invoice/AP, or Issue on any live transaction.
- **Do not** issue a HOUSE BL/HBL/AWB/HAWB: eligible issue actions create invoice/AP drafts.
- **Do not** post invoices, receipts, checks, bridge rows, or FS journals; do not print a check, reverse, void, settle, recompute balances, or close a month.
- **Do not** close/reopen a shipment; closed files are immutable and reopening requires elevated role and a reason.
- **Do not** demonstrate tariffs as automated/live unless an active matching tariff is visible and tested.
- **Do not** claim live FX, BOC, carrier tracking, scanners, signature pads, printer integration, customer document download, customer invoice balances, or payment gateway features.
- **Do not** expose real party contact details, email, TIN, bank, check, credentials, audit details, or unrelated customer records.
- **Do not** quote dashboard/AR/AP figures from the supplied browser snapshot (it showed a 401 event) or counts from the local DB/HANDOFF as current production values.
- **Do not** use broad FS admin, user management, integration toggles, database/query browser, or system diagnostics in a client-facing flow.

15 UNKNOWN AREAS I NEED TO CONFIRM WITH THE DEVELOPMENT TEAM

1. Which exact environment and account are approved for this client demo; does the current account have the needed operations/accounting/FS permissions?
2. Do `QT-2026-00002`, `OE-2026-00002`, its QA HBL, invoice, AP bill, receipt/check, and bridge rows still exist together in the current live tenant, and do their statuses/amounts still match?
3. Why did the attached browser snapshot show a 401 event and a sparse `OE-2026-00001` row while current handoff notes describe a different QA dataset?
4. Is `OE-2026-00001` a valid client-safe fallback, and does it have cargo/docs/status history beyond the fields visible in the list?
5. Does the approved demo account have FS access and permissions for each Billing/Bridge/Reports screen?
6. Which status transitions are guarded by approvals or external evidence, and are all status events audit logged?
7. Does public tracking require particular event codes, and which approved synthetic reference has a non-empty public milestone timeline?
8. Are any external integration catalogue entries actually connected in production, and what does "connected" operationally mean?
9. Is live FX sourced from an external provider or manually maintained?

10. What is the approved period policy for newly generated draft invoice/AP records? Historical notes said the FS period was September 2026 while new drafts defaulted to October; never post them until finance confirms.
11. Which exact report outputs/export formats are approved for external discussion; are reports reconciled to official FS records?
12. What data retention, privacy, audit coverage, backup/restore, recovery-time, availability, and scalability commitments can be stated to clients?
13. Are invoice/customer portal visibility, downloadable documents, and online payments planned, or explicitly out of scope?
14. Has the in-progress worktree/deployment completed, and was its final build and the exact demo tenant smoke-tested after deployment?
